

Photo grid

I want you to create a prompt that includes different camera shots: full body shots, side view shots, close-up shots, and behind-the-back shots. The character should be 160 cm tall. Present it in a grid format so it can be generated as one image.

flow

I want to create animation content, and you will help me generate prompts. I'll give you ideas or a system, and you will improve them. I need two prompts: Prompt A for the image, and Prompt B for the animation. I'll use Grok AI for video animation, so each clip should be 6 seconds only. Make sure the character stays consistent throughout. There should be no background music, only sound effects if needed, and no talking characters. The format should always be 9:16.

After ai answer the flow you paste, copy this and paste it again:

Make it in paragraph form. You will send me Prompt A first, and I will review it. If it's approved, I will say "turn it into image." After that, I will provide the idea for Prompt B.

move to new tab

I want to move to a new tab, but I need my content and character to stay consistent. Can you create a prompt system based on our current setup? It should include the character details, Prompt A for the image, and Prompt B for the animation. There should be no background music, only sound effects if needed, and no talking characters. Add a final instruction stating that I will provide a reference image so the character can be copied 100% accurately.

skeleton

A stylized, transparent human body with a visible, realistic skeleton inside. Ectomorph, 180 cm tall. The body appears translucent, like glass, with clearly defined bones, rib cage, spine, arms, and legs. Translucent across the entire body surface, except for the skull and eyes. Soft studio lighting, high detail, ultra-realistic 3D rendering, clean anatomy, realistic materials, no blood. Round human eyes are also present. In the center of the scene: a skeleton sitting at an empty table. Camera angle: in front of the skeleton, slightly further back to get a wider view. Background: {{blue gradient background}} Centered composition, vertical 9:16 format. High resolution, sharp focus, modern, minimalist aesthetic.

Photo comparing prompt

Create a high-quality, vertically oriented (1080x1350 for Instagram) split-screen image designed for an emoji voting system. On the left side, show a realistic, eye-catching scene representing Option A of [put your topic]. On the right side, show an equally engaging scene representing Option B of [put your topic]. At the top, include bold white text asking a simple, direct question like: “Which would YOU choose?” or “Which one is WORSE?” depending on the topic. Below each image, place the name of the option in bold text and the corresponding emoji reaction: = Option A = Option B Add a subtle watermark at the bottom center: @yourhandle. The style should be optimized for social media: bold, readable, and engaging.

Remedies

You are my AI content assistant for creating cinematic health content. We are producing ultra-realistic vertical short videos for social media platforms like Reels, TikTok, and Shorts. The visual style must always be super realistic, cinematic, and highly detailed, similar to professional photography or medical visualizations. Avoid cartoon styles and avoid sci-fi effects unless I specifically ask for them. The goal is to make every scene feel immersive, realistic, and visually satisfying while still educational.

Our workflow always follows the same structure. Every scene must have two prompts: Prompt A and Prompt B. Prompt A is used for image generation and must describe a single still frame of the scene with clear details about the environment, camera angle, lighting, and objects. Prompt B is used for animation (which I will generate using Grok). Animation prompts must always be exactly 6 seconds long, in 9:16 vertical format, with cinematic camera movement and realistic motion. There must be no background music, only sound effects if needed.

It is very important that you always send Prompt A first and wait for my approval before creating Prompt B. Once I confirm the image looks correct, you can then generate Prompt B for the animation of that same scene. This keeps the visuals consistent throughout the video.

The camera style should feel cinematic and dynamic. You can use perspectives such as POV shots, high-angle shots, macro shots, cinematic close-ups, and slow push-in camera movements. When the scene involves anatomy, the camera may zoom inside the body to show organs like the liver, kidneys, or eyes. These anatomy scenes must look like realistic medical visualizations with accurate textures and natural colors.

The types of scenes we create include realistic kitchen scenes, food preparation, natural remedies, and medical or body anatomy explanations. When organs are shown, the body may be slightly transparent to reveal the internal organs, but the style must remain clinical and realistic. Do not add glowing sci-fi effects unless specifically requested.

For visual impact, the scenes should feel satisfying and engaging. This can include macro textures, liquid movements like honey or juice dripping, particles such as grated carrot falling, smooth transformations, or slow cinematic camera movements. The goal is to make the content visually appealing while still looking believable and realistic.

The overall goal is to create cinematic health storytelling scenes that feel professional, realistic, and educational. Every scene should look like it belongs to the same high-quality video so the content remains visually consistent from start to finish.

Health Facts Brainrot Script Prompt

Create a short-form viral script using a brainrot style about “Top worst foods” or “Top best foods” for a specific body part such as the heart, brain, stomach, skin, or energy levels. The script must be simple, direct, and written in short lines for high retention. Start with a strong hook like “Top 5 foods that damage your [body part]” or “Top 5 best foods for your [body part]” followed by a curiosity line such as “Number 1 will shock you” or “You eat this every day.” Then create a countdown structure using “Number 5” to “Number 1” (or any number depending on the request). Each line must follow this format: “[Food] because [short clear effect on the body]” using simple words and slightly negative or alarming tone for worst foods, and positive tone for best foods. Keep each sentence similar in length to maintain rhythm. Focus on one clear effect per line like “damages your heart,” “spikes sugar,” “clogs your system,” “boosts energy,” or “improves digestion.” Avoid long explanations and keep it concise and engaging. End with a call to action like “Follow for more.”
